The 1962-63 Corvair electrical systems are basically the same as outlined in the 1961 Corvair Shop Manual, except for the following changes.

BATTERY

A 9 plate (per cell) 42 ampere hour battery (fig. 8-1) is now used for standard production models. Maintenance and service procedures are the same except as follows:

**Slow Charge**

Adjust electrolyte to proper level by adding distilled water, then charge battery at 5 amperes for a minimum of 10 hours. Full charge of the battery is indicated when three hourly hydrometer readings show no increase in specific gravity. Due to the slow charge rate, periods of 24 hours or more are often encountered.

**The Full Charge Hydrometer Test**

1. Make sure battery is fully charged as described under "Slow Charge." Hydrometer readings taken on partially charged batteries are unreliable for the following test.
2. Measure specific gravity of electrolyte in each cell and compare readings with the following:
   - If cell readings range between 1230 and 1310, the battery is ready for use. Any variation in the specific gravity between cells within this range does not indicate a defective battery.

DISTRIBUTOR

**TURBO—SUPERCHARGED DISTRIBUTOR**

The distributor used on turbo-supercharged engines is different in that a pressure retard unit replaces the ordinary advance unit. This unit retards the spark during the time the manifold is pressurized, partially opposing centrifugal advance at high engine rpm. The curve is as shown in figure 8-2.

Service operations are the same as on regular distributor.
MAINTENANCE AND ADJUSTMENTS

Contact Point Replacement

Refer to Figures 8-3 through 8-5

1. Release distributor cap hold-down screws, remove cap and place it out of work area.
2. Remove rotor.
3. Pull primary and condenser lead wires from contact point quick-disconnect terminal (fig. 8-3).
4. Remove contact set attaching screw, lift contact point set from breaker plate (fig. 8-3).
5. Clean breaker plate of oil smudge and dirt.

6. Place new contact point assembly in position on breaker plate, install attaching screw.

**CAUTION:** Carefully wipe protective film from point set prior to installation.

**NOTE:** Pilot on contact set must engage matching hole in breaker plate.

7. Connect primary and condenser lead wires to quick disconnect terminal on contact point set.

8. Check and adjust points for proper alignment and breaker arm spring tension (fig. 8-4). Use an aligning tool to bend stationary contact support if points need alignment.

9. Set point opening (.019" for new points) (fig. 8-5).

10. Rotate cam lubricator 90° (fig. 8-3).

11. Reinstall rotor, position and lock distributor cap to housing.

12. Check and set ignition timing. (See Engine Tune-Up, Section 7.)

**Condenser Replacement**

Refer to Figure 8-3

1. Release distributor cap hold-down screws, remove cap and place it out of work area.

2. Remove rotor.

3. Disconnect condenser lead wire from contact point quick disconnect terminal.

4. Remove condenser attaching screw, lift condenser from breaker plate. Wipe breaker plate clean.

5. Install new condenser using reverse of procedure outlined above.

**SERVICE OPERATIONS**

**Removal**

1. Release distributor cap hold-down screws, remove cap and place it out of work area.

**NOTE:** If necessary to remove secondary leads from distributor cap, mark position on cap tower for lead to No. 1 cylinder. This will aid in reinstallation of leads in cap.

2. Disconnect distributor primary lead from coil terminal.

3. Scratch a realignment mark on distributor in line with rotor segment (fig. 8-3).

4. Disconnect vacuum line from vacuum control assembly, remove distributor hold-down bolt and clamp, remove distributor from engine. Note position of vacuum advance assembly relative to engine for correct reinstallation (fig. 8-6).

**Disassembly**

With the distributor removed from the vehicle it is advisable to place it in a distributor testing machine or synchroscope.

**CAUTION:** When mounting the distributor in any distributor testing machine or synchroscope, extreme care must be taken not to score or otherwise damage the lower distributor shaft with the testing machine drive mechanism. A protective adapter, with bushing, available from the manufacturers of such testing machines for use with the Corvair distributor, must be used over the lower 1 ¼" of the distributor shaft.

Test the distributor for variation of spark, correct centrifugal and vacuum advance and condition of contacts. This test will give valuable information on distributor condition and indicate parts replacement which may be necessary. Check area on breaker plate just beneath breaker points. A smudgy line indicates that oil or crankcase vapors have been present between points.

Refer to Figure 8-7 for exploded view of distributor.

1. Remove rotor.

2. Remove vacuum control assembly retaining screws, remove unit from distributor housing.

3. Disconnect primary and condenser leads from contact point quick disconnect terminal, remove contact point set attaching screw, condenser attaching screw, remove point set and condenser from breaker plate.
4. Remove breaker plate attaching screws, remove breaker plate from distributor housing (fig. 8-3).  
   **NOTE:** Do not disassemble breaker plate any further.

5. Remove roll pins retaining driven gear and thrust washers to mainshaft, slide gear and washers from shaft.

6. Slide cam and mainshaft from distributor housing.

7. Remove weight cover and stop plate screws, remove cover, weight springs, weights, and slide cam assembly from mainshaft.

### Cleaning and Inspection

1. Wash all parts in cleaning solvent except cap, rotor, condenser, breaker plate assembly, cam lubricator and vacuum control assembly. Degreasing compounds may damage condenser insulation or plastic insulators on the breaker plate assembly.

2. Inspect breaker plate assembly for damage or wear and replace if necessary.

3. Inspect mainshaft for wear, check its fit in the bushing in the distributor housing. If the shaft or bushing is worn, the shaft and distributor body should be replaced.

   **NOTE:** Distributor housing bushing not serviced separately.

4. Mount the shaft in "V" blocks and check the shaft alignment with a dial gauge. The runout should not exceed .002".

5. Inspect the governor weights for wear or burrs and free fit on their pins.

6. Inspect the cam for wear or roughness. Then check its fit on the end of the shaft. It should be absolutely free, without any looseness.

7. Inspect the condition of the distributor points (see Distributor Contact Points). Dirty points should be cleaned and badly pitted points should be replaced.

8. Test the condenser for series resistance, microfarad capacity (.18 to .23), leakage or breakdown, following the instructions given by the manufacturer of the test equipment used.

9. Inspect the distributor cap and spark plug wires for damage.

### Assembly

Refer to Figure 8-7 for exploded view of distributor.

1. Replace cam assembly to mainshaft.

   **NOTE:** Lubricate top end of shaft with light engine oil prior to replacing.

2. Install weights on their pivot pins, replace weight springs. Install weight cover and stop plate (fig. 8-8).

3. Lubricate mainshaft, install it in distributor housing.

4. Install thrust washers and driven gear to mainshaft, install retaining roll pins. Check to see that shaft turns freely.
5. Position breaker plate assembly in housing and attach retaining screws (see fig. 8-3).

6. Attach condenser and contact point set in proper location with appropriate attaching screws. Connect primary and condenser leads to contact set quick disconnect terminal.

**NOTE:** Contact point set pilot must engage matching hole in breaker plate.

7. Attach vacuum control assembly to distributor housing using upper mounting holes.

8. Install cam lubricator.

9. Install rotor to cam assembly.

**Installation—Engine Not Disturbed**

1. Turn rotor approximately ⅛ turn counterclockwise past mark previously scratched on distributor housing.

2. Work distributor down into position in engine block with distributor positioned as noted prior to removal—vacuum control unit in same relative position to engine.

**NOTE:** It may be necessary to move rotor slightly to start gear into mesh with crankshaft gear, but rotor should line up with the mark when distributor is down in place.

3. Replace distributor hold-down clamp and bolt. Connect primary lead to coil terminal. Replace distributor cap. Also install spark plug and coil secondary wires if removed (fig. 8-9).

**CAUTION:** Care should be used in tightening distributor cap screws to prevent cracking the cap.

**NOTE:** Wires must be installed as indicated to prevent cross-firing.

4. Set points and time ignition as outlined under Engine Tune-Up, Section 7.

5. Connect vacuum hose to control unit.

**Installation—Engine Disturbed**

1. Locate Number 1 piston in firing position by either of two methods described below.

   a. Remove Number 1 spark plug and with compression gauge on plug hole crank engine until compression is indicated in Number 1 cylinder. Continue cranking until crankshaft timing notch lines up with “O” timing mark on engine rear housing pad or . . .

   b. Remove right bank rocker cover and crank engine until Number 1 intake valve closes and continue to crank slowly until “O” pointer lines up with “0” timing mark on engine rear housing pad.

2. Work distributor down into position in engine block with distributor positioned as noted prior to removal—vacuum control unit in same relative position to engine.

**NOTE:** It may be necessary to move rotor slightly to start gear into mesh with crankshaft gear, but rotor should line up with the mark when distributor is down in place.

3. Replace distributor hold-down clamp and bolt. Connect primary lead to coil terminal. Replace distributor cap. Also install spark plug and coil secondary wires if removed (fig. 8-9).

**CAUTION:** Care should be used in tightening distributor cap screws to prevent cracking the cap.

**NOTE:** Wires must be installed as indicated to prevent cross-firing.

4. Set points and time ignition as outlined under Engine Tune-Up, Section 7.

5. Connect vacuum hose to control unit.
up with timing notch on crankshaft pulley.

2. Position distributor to opening in block in normal installed attitude.

3. Position rotor to point toward harmonic balancer of engine (with distributor housing held in installed attitude), then turn rotor clockwise approximately \( \frac{3}{8} \) turn more toward left cylinder bank and push distributor down to engage crankshaft. It may be necessary to rotate rotor slightly until crankshaft engagement is felt.

4. While pressing firmly down on distributor housing, kick starter over a few times to make sure oil pump shaft is engaged. Install hold-down clamp and bolt and snug up bolt.

5. Turn distributor body slightly until points just open and tighten distributor clamp bolt.

6. Place distributor cap in position and check to see that rotor lines up with terminal for Number 1 spark plug.

7. Install cap, check all high tension wire connections and connect spark plug wires if they have been removed (see fig. 8-9). It is important that the wires be installed in their proper location in the supports.

8. Connect vacuum line to distributor and distributor primary wire to coil terminal.

9. Start engine and set timing as described under Tune-up in Section 7.

**WINDSHIELD WIPER**

**GENERAL DESCRIPTION**

The regular production, single-speed electric windshield wiper assembly available on the 1962-63 Corvair Passenger Cars and Trucks incorporates a new design, non-depressed type (blades park approximately 2" above windshield moulding) motor and gear train. The rectangular, 12 volt, shunt wound motor is similar to 1961 models, but is coupled to a new type gear train consisting of a helical drive gear at the end of the motor armature shaft, an intermediate gear and pinion assembly, and an output gear and shaft assembly. The crank arm is attached to the output gear shaft.

The optionally available two-speed, non-depressed wiper and washer assembly is of a new design incorporating a rectangular, compound wound (series and shunt field) motor adapted to the same type gear train as that used with the new single-speed wipers.

Two switches, connected in parallel, control the starting, stopping and parking of both types of wiper motors. The manually operated start, stop switch is located on the dash panel, while the cam operated park switch is located in the wiper gear box.

**SERVICE OPERATIONS**

**WIPER TRANSMISSION ASSEMBLY**

Removal and Installation procedures remain the same as 1961 Corvair Passenger and Truck Models.

**WIPER MOTOR ASSEMBLY**

Removal and Installation procedures remain the same as 1961 Corvair Passenger and Truck Models, except for location on Corvair Passenger.

**Disassembly**

**Gear Box**

Refer to Figure 8-10 for explode of motor and gear train.

1. Clamp crank arm in a vise and remove crank arm retaining nut.

2. Remove crank arm, seal cap, Tru-Arc retaining ring, flat washer and shims where applicable.

3. Drill out gear box cover retaining rivets, remove cover from gear train.

**NOTE:** Mark ground strap location for proper reinstallation.

4. Remove output gear and shaft assembly and slide intermediate gear and pinion assembly off shaft.

**NOTE:** Wave washer located on intermediate gear and pinion shaft.
5. When necessary, remove terminal board and park switch assembly as follows:
   a. Unsolder motor leads from terminals. Coding of motor leads not necessary on Type “E” single-speed wipers.
   b. Drill out rivets securing terminal board and park switch ground strap to mounting plate (fig. 8-12).

Motor

Refer to Figure 8-10.

1. Remove motor thru bolts, tap motor frame lightly, remove motor from mounting plate.
Inspection

Check and inspect all parts for serviceability, replace as necessary. All parts can be replaced individually except motor frame and field, which is serviced as an assembly. Service kits also provide screws, nuts, and washers to replace gear cover and terminal board rivets.

Assembly

Motor

Refer to Figure 8-10 for explode of motor and gear train.

1. Reassemble motor using reverse of disassembly procedure outlined above.

   NOTE: Lubricate armature shaft bushings with light machine oil. Armature end play is automatically adjusted by the proper installation of end play wave washers (fig. 8-14).

Gear Box

Refer to Figure 8-10 for explode of gear box.

1. Assemble gear box using reverse of disassembly procedure.

   NOTE: Lubricate gear teeth with Delco Cam and Ball Bearing Lubricant. Be sure cover is properly located over dowel pins and be sure to reinstall ground strap.

2. Operate wiper to park position and install crank arm on output shaft so alignment marks line up with those on cover (fig. 8-15). Replace retaining nut, place crank arm in vise, tighten retaining nut.

---

Fig. 13—Removing Brush Spring from Slot

2. Release brush spring tension (fig. 8-13), slide armature and end plate from motor frame. Pull end plate from armature.

   NOTE: Thrust plug located between armature shaft and end plate.

3. Remove end play adjusting washers from armature, noting arrangement for proper reinstallation.

Fig. 14—End Play Washers Installed

Fig. 15—Wiper Crank Arm in Park Position
WINDSHIELD WASHER

GENERAL DESCRIPTION

The positive displacement washer pumps used on the new 1962-63 one and two speed non-depressed park wipers differ considerably in appearance from the 1961 integral type pump (fig. 8-16), but the basic pumping action and valve arrangement remains the same. The pump mechanism consists of a small bellows, bellows spring and valve arrangement driven by a 4 lobe nylon cam and pin assembly (fig. 8-17). The wiper motor drives the cam (fig. 8-18). Programming is accomplished electrically and mechanically by a relay assembly and ratchet wheel arrangement.

SERVICE OPERATIONS

Removal and Installation

Removal of the washer pump from the wiper motor consists of:

1. Disconnect wiring harness from washer.
   NOTE: Mark washer hoses for correct reinstallation.

2. Remove washer mounting bracket to wiper retaining screws, remove washer from wiper.

3. Reverse above procedure to install assembly.

CAUTION: Install washer multiplug harness connector with battery lead on terminal with no tang (fig. 8-16). Incorrect installation of connector will result in direct ground and destroy wiper motor fuse.

Disassembly-Assembly

Refer to Figure 8-17.

1. Remove washer pump cover.

2. Relay.

   a. To remove relay unsolder coil leads from terminals.

   NOTE: No coil polarity is necessary when resoldering coil leads.

   b. Remove coil retainer clip and slip coil assembly out of mounting bracket.

   a. To remove ratchet pawl, disengage spring from ratchet pawl.

   CAUTION: Be sure spring is properly assembled before replacing washer pump cover.

   b. Remove “E” ring and slide ratchet pawl off shaft.

4. Valve Assembly.

   a. To remove valve assembly, remove 4 screws that secure valve assembly to bellows housing.

   CAUTION: It may be necessary to carefully pry bellows lip out of the valve body groove.

5. Bellows.

   a. To remove bellows first remove valve assembly.

   b. Manually operate pump clockwise to release pump from “lock-out” position (fig. 8-19).
c. Hold bellows plunger arm from moving, then push in against bottom of bellows with thumb and twist 90° to remove bellows and bellows spring from housing.

6. To assemble washer unit, reverse above procedures.

**TROUBLE SHOOTING PROCEDURES—SINGLE SPEED**

**NOTE:** Should the wiper motor stall under severe operating conditions, the wiper blades will not necessarily return to park position automatically and motor will continue to operate. Turning the dash switch “off” will not de-energize the circuit and the wiper arms will have to be parked manually or the wiper motor must be allowed to cool. The wiper motor will recover without damage after cooling.
# TROUBLE SHOOTING PROCEDURES—SINGLE SPEED—Continued

<table>

<tr>
<th>Trouble Condition</th>
<th>WIPER INSTALLED IN CAR</th>
<th>WIPER DETACHED</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A. WIPER INOPERATIVE</strong>&lt;br&gt;—Important: Ignition switch must be on to make electrical tests.</td>
<td>1. Check the following:&lt;br&gt;(1) Car wiring harness is properly attached to wiper terminals and dash switch.&lt;br&gt;(2) Wiper ground strap properly connected to wiper and car body.&lt;br&gt;(3) Dash switch is mounted securely in dash.&lt;br&gt;(4) Check fuse.&lt;br&gt;2. If everything checks out in Step 1 and wiper fails to operate, disconnect wiring harness from wiper and check for 12 volts at harness terminal that connects to wiper terminal No. 2, Figure 8-20. No voltage indicates defective car wiring. <strong>CAUTION: DO NOT connect hot line to No. 1 Terminal.</strong>&lt;br&gt;3. Connect 12 volt supply to No. 2 wiper terminal and connect a jumper wire from terminal No. 1 to ground (fig. 8-16). If wiper operates, the dash switch or wiring between dash switch and wiper is defective.&lt;br&gt;4. If wiper fails to operate in Step 3 remove body parts as required to disconnect wiper transmission from wiper crank arm. Recheck wiper operation as explained in Step 3. If wiper operates correctly a defective transmission or binding condition exists. If wiper still fails to operate, remove wiper from car and follow instructions under trouble shooting—wiper detached.</td>
<td>—Current Draw—0&lt;br&gt;1. Check solder connection at terminal board.&lt;br&gt;2. Disassemble motor section and check all splice connections (fig. 8-21).&lt;br&gt;—Current Draw—2-3 amps&lt;br&gt;1. Disassemble motor and check for the following items:&lt;br&gt;   a. Open armature.&lt;br&gt;   b. Brushes sticking.&lt;br&gt;   c. Brush springs improperly positioned (See fig. 8-13).&lt;br&gt;   d. Loose or frayed brush pigtail connections at splice joints.&lt;br&gt;—Current Draw—10-12 Amps&lt;br&gt;1. Check for open shunt field circuit.&lt;br&gt;2. Check for broken gear.</td>
</tr>
<tr>
<td><strong>B. WIPER WILL NOT SHUT OFF.</strong></td>
<td>1. Disconnect wiring from dash switch. If wiper shuts off, a defective dash switch is indicated.&lt;br&gt;2. If wiper still operates in Step 1, disconnect wiring from wiper and connect 12 volt supply direct to wiper terminal No. 2 (fig. 8-20). DO NOT connect any jumper wire to terminal No. 1.&lt;br&gt;—Wiper shuts off correctly—check for grounded lead that extends between wiper terminal No. 1 and dash switch.&lt;br&gt;—Wiper fails to shut off—remove wiper from car and follow instructions under “Trouble Shooting Wiper Detached.”</td>
<td>Wiper crank arm fails to stop in park position when jumper wire is removed from wiper Terminal No. 1, Figure 8-20.&lt;br&gt;1. Check that park switch contacts are opening.&lt;br&gt;2. Check for grounded condition in the internal motor lead that connects to terminal No. 1, Figure 8-20.</td>

Trouble Condition | What To Look For
--- | ---
**B. WIPER WILL NOT SHUT OFF**
If wiper still fails to operate correctly in Step 2, remove it from car and check it per instructions under trouble shooting—wiper detached.

**C. WIPER HAS ONE SPEED—FAST**

1. Determine if wiper has both “Lo” and “Hi” speeds, “Lo” speed only, or “Hi” speed only. (Important—wiper must operate in “Lo” speed during parking cycle).

2. Disconnect wiring harness from wiper motor and try operating wiper independently of dash switch as shown in Figure 8-22.

---

**WIPER INSTALLED IN CAR**

**Possible Trouble**

| Wiper has both speeds | (1) Park switch contacts not opening.  
(2) Internal wiper motor lead that connects to wiper terminal No.1 grounded |
| Wiper has “Lo” speed only | (1) Internal wiper motor lead that connects to wiper terminal No.3 grounded  
(2) Shunt field coil grounded |
| Wiper has “Hi” speed only | (1) Internal wiper motor lead that connects to wiper terminal No.3 open  
(2) Shunt field open |

**WIPER DETACHED**

---

**Step 1 Diagnosis**

| Wiper has both speeds | (1) Lead between wiper terminal No.1 and dash switch grounded.  
(2) Defective dash switch. |
| Wiper has “Lo” speed only | (1) Lead between wiper terminal No.3 and dash switch grounded.  
(2) Defective dash switch. |
| Wiper has “Hi” speed only | (1) Lead between wiper terminal and dash switch open.  
(2) Defective dash switch. |

**D. WIPER HAS ONE SPEED SLOW AND SHUTS “OFF” WITH DASH SWITCH IN “HI” SPEED POSITION**

1. Reverse harness leads that connect to wiper terminals 1 and 3.  
—See Typical Trouble (B) above.

**E. BLADES DO NOT RETURN TO PARK POSITION WHEN WIPER IS TURNED “OFF”**

1. Check wiper ground strap connection to car body.
2. Remove wiper from car and check for dirty, bent or broken park switch contacts.

**F. WIPER SPEED NORMAL IN “LO” BUT TOO FAST IN “HI”**

1. Remove wiper from car and check for an open terminal board resistor.

1. Check for open 24 ohm resistor on back of wiper terminal board.

**G. INTERMITTENT OPERATION**

1. Check for loose wiper ground strap connections and/or loose dash switch mounting.
1. Check for sticking brushes, loose splice joints, etc.
## WASHER PUMP

### A—WASHER INOPERATIVE:

1. Check the following items:
   - (1) Jar has adequate quantity of water solution.
   - (2) Hoses are not damaged and hose connections are tight.
   - (3) Screen at end of jar cover hose is not plugged.
   - (4) Electrical connections to washer pump and dash switch.
   - (5) Nozzles are not plugged.

2. If all items in step No. 1 check out, start wiper motor only, then push washer button and listen for "click" as washer relay pulls in. If no "click" is heard, check for 12 volts at terminal No. 2 (fig. 8-25). No voltage indicates defective wiring. If "click" is heard, proceed to step 4.

3. If correct voltage was found in step No. 2, connect a jumper wire from terminal No. 1 to ground (fig. 8-25) and operate wiper. If washer relay "click" is heard and pump functions correctly, a defective dash switch or an open circuit between washer pump and dash switch is indicated—"No Click" indicates an open relay coil.

4. If pump performs correctly in Step 3, continue to manually rotate the 3 lobe cam one lobe in a clockwise direction (looking at the cam). Observe if relay holding contacts close (fig. 8-24) and the pump plunger arm is released from its lock-out position. (Fig. 8-19 shows plunger arm in lock-out position.)

5. Check for proper gear engagement. Check to see that cam gear teeth are not damaged.

## WASHER PUMP DETACHED

Check Pump Operation as follows:

1. Remove washer pump cover and connect 12 volt power supply to washer pump as shown in Figure 8-23. Connect jumper wire from terminal No. 1 to ground. Turn ratchet pawl to the position shown in Figure 8-24. Ratchet pawl should be pulled toward relay pole and engage ratchet teeth. Failure to do as described above indicates an open relay coil.

2. If relay and ratchet pawl perform correctly in Step 1, manually rotate the 3 lobe cam one lobe in a clockwise direction (looking at the cam). Observe if relay holding contacts close (fig. 8-24) and the pump plunger arm is released from its lock-out position. (Fig. 8-19 shows plunger arm in lock-out position.)

3. Disconnect jumper wire from terminal No. 1. Relay coil should remain energized and hold ratchet pawl against ratchet wheel. Failure to do so indicates open or dirty holding contacts.

4. If pump performs correctly in Step 3, continue to manually rotate the 3 lobe cam until the ratchet wheel has been turned through 360° or 21 teeth. After the ratchet wheel has been rotated 21 teeth, the holding contacts should be opened by a "hump" on the wheel and the pump plunger arm should be in the "lock-out" position (fig. 8-19).

Check Valve Assembly as follows:
### Trouble Condition | What To Look For
---|---
**WASHER PUMP ON CAR** | **WASHER DETACHED**

1. Attach a hose to the large or intake pipe. You should be able to blow through it but not draw through it.
2. Attach a hose individually to each of the small or exhaust pipes. You should be able to draw through them but not blow through them. If any of three valves allow air to pass in both directions, the valve assembly is defective.

### B. WASHER PUMP OPERATES CONTINUOUSLY

With wiper motor running and washer operating continuously, check the following:

1. Contact point adjustment—points should be open when ratchet wheel ramp is engaged. Points should be closed when not engaged with ramp.
2. Continuity of coil and pole assembly.
3. Ratchet pawl spring broken or disengaged.
4. Ratchet wheel brake broken or misaligned.

---

**Fig. 8-22—Checking Two-Speed Wiper Circuit**

**Fig. 8-23—Bench Checking Pump Operation**
SPYDER INSTRUMENTS AND GAUGES

INSTRUMENT CLUSTER

All instruments, gauges or indicators are located in the instrument cluster (fig. 8-26). The cluster must be removed from the opening above the steering wheel prior to individual instrument removal.

ENGINE WARNING SYSTEM

The instrument cluster used on the Monza Spyder has in addition to the standard Corvair warning lights, a cylinder head temperature gauge and an engine overheat warning buzzer.

The gauge indicates cylinder head temperature anytime the ignition switch is “ON.” Should the engine overheat, the “TEMP-PRESS” light and the buzzer will operate.

NOTE: If oil pressure is low, only the “TEMP-PRESS” light operates. If the engine temperature is too high, both the light and the buzzer operate. THIS IS THE POSITIVE WARNING SYSTEM. If the gauge needle travels past range, or the light and/or buzzer operate, follow the instructions in the Corvair Owner’s Guide.

Figure 27 shows the engine warning system circuit. The Silicon Rectifier located between the light circuit and the buzzer circuit allows the light current to flow to ground through the closed engine temperature switch, but prevents the oil pressure switch from completing the buzzer circuit.

WIRING DIFFERENCES

Tachometer leads are attached at coil in engine compartment. Temperature indicator lamp, gauge and warning buzzer are connected as shown in wiring diagram (fig. 27). The Thermister unit (fig. 28) is installed on left cylinder head, the temp pickup in the right head and the warning buzzer and diode are located under dash panel (the diode in wire harness).
